## 1 The Model

Let  $y_{g,n}$  be the expression level of gene  $g$  ( $g = 1, \dots, G$ ) in library  $n$  ( $n = 1, \dots, N$ ). Let  $\mu(n, \phi_g, \alpha_g, \delta_g)$  be the function given by:

$$\mu(n, \phi_g, \alpha_g, \delta_g) = \begin{cases} \phi_g - \alpha_g & \text{library } n \text{ is in treatment group 1} \\ \phi_g + \delta_g & \text{library } n \text{ is in treatment group 2} \\ \phi_g + \alpha_g & \text{library } n \text{ is in treatment group 3} \end{cases}$$

Then:

$$\begin{aligned} y_{g,n} &\sim \text{Poisson}(\log(c_n + \varepsilon_{g,n} + \mu(n, \phi_g, \alpha_g, \delta_g))) \\ c_n &\sim \text{N}(0, \sigma_c^2) \\ \sigma_c &\sim \text{U}(0, 1) \\ \varepsilon_{g,n} &\sim \text{N}(0, \sigma_g^2) \\ \sigma_g &\sim \text{Gamma}\left(\frac{d \cdot \sigma_0^2}{2}, \frac{d}{2}\right) \\ d &\sim \text{U}(0, 1000) \\ \sigma_0^2 &\sim \text{Exp}(1) \\ \phi_g &\sim \text{N}(\theta_\phi, \sigma_\phi^2) \\ \theta_\phi &\sim \text{N}(0, 1000) \\ \sigma_\phi &\sim \text{U}(0, 1000) \\ \alpha_g &\sim \pi_\alpha \text{I}(\alpha_g = 0) + (1 - \pi_\alpha) \text{I}(\alpha_g \neq 0) \text{N}(\theta_\alpha, \sigma_\alpha^2) \\ \theta_\alpha &\sim \text{N}(0, 1000) \\ \sigma_\alpha &\sim \text{U}(0, 1000) \\ \pi_\alpha &\sim \text{U}(0, 1) \\ \delta_g &\sim \pi_\delta \text{I}(\delta_g = 0) + (1 - \pi_\delta) \text{I}(\delta_g \neq 0) \text{N}(\theta_\delta, \sigma_\delta^2) \\ \theta_\delta &\sim \text{N}(0, 1000) \\ \sigma_\delta &\sim \text{U}(0, 1000) \\ \pi_\delta &\sim \text{U}(0, 1) \end{aligned}$$

where:

- Independence is implied unless otherwise specified.
- The parameters to the left of the “ $\sim$ ” are implicitly conditioned on the parameters to the right.

This gives us the full conditional posteriors up to a normalizing constant. Below,  $k(n)$  is the treatment group of library  $n$ .

$$\begin{aligned}
p(c_n \mid \cdots) &\propto \left[ \prod_{g=1}^G \text{Poisson}(y_{g,n} \mid \log(c_n + \varepsilon_{g,n} + \mu(n, \phi_g, \alpha_g, \delta_g))) \right] \text{N}(c_n \mid 0, \sigma_c^2)^G \\
